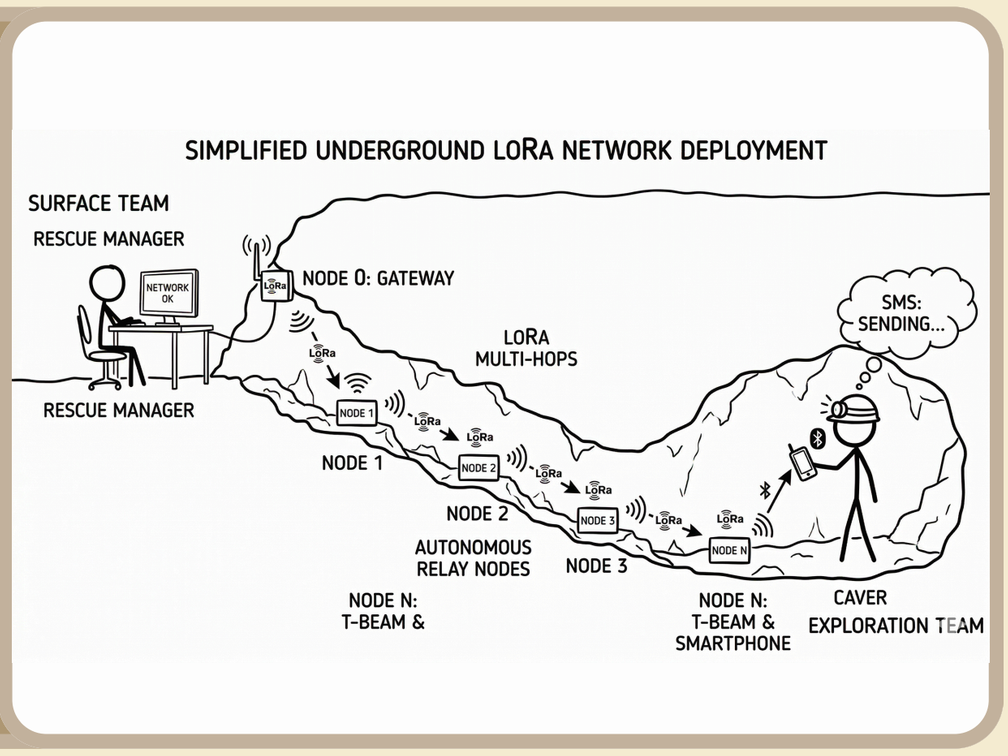
SpeleoLora, Chained nodes for cave exploration

The Project

A LoRa communication system with linked nodes that allows people to keep contact with the outside world while moving underground (mostly in cave exploration).

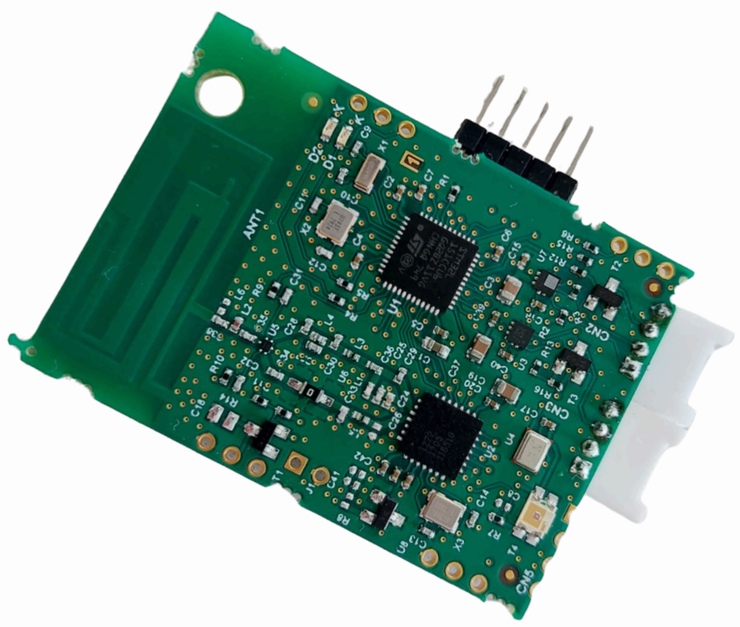


First Node: LoRaE5 DevKit

Stationed at the cave entrance, this node links the surface to the underground network. It initiates the communication chain and ensures a reliable message transmission.

Chained Nodes : WyresV2

Deployed as the exploration continues, these autonomous relay nodes extend the signal range. They automatically link together when powered on and signal when another one need to be added



Last Node, Tbeam TTGO and Application

Tthis mobile node pairs with a custom smartphone app. It allows users to easily send and receive texts and alerts, while monitoring network status.
